LOGIC AND SET THEORY A rigorous analysis of set theory belongs to the foundations of mathematics and mathematical logic. The study of these topics is, in itself, a formidable task. For our purposes, it will suffice to approach basic logical concepts informally. That is, we

Set Theory and Logic

There is a natural relationship between sets and logic. If A is a set, then $P(x) = \{x \in A\}$ is a formula. It is true for elements of A and false for elements outside of A .

Conversely, if we are given a formula $Q(x)$, we can form the truth set consisting of all x that make $Q(x)$ true. This is usually written $\{x: Q(x)\}$ or $\{x \mid Q(x)\}$.

Then $A = B$ if they contain exactly the same elements, that is $a \in A \iff a \in B$. To prove that two sets A and B are equal, we need to show that for all $a \in A$ we have $a \in B$ and for all $a \in B$, we have $a \in A$. Claim 3. Let A and B be sets.

Introduction to Logic and Set Theory- 2013-2014
Set theory With the exception of its first-order fragment, the intricate theory of Principia Mathematica was too complicated for mathematicians to use as a tool of reasoning in their work. Instead, they came to rely nearly exclusively on set theory in its axiomatized form.
